The Rover Software of the VIPER Mission

Hans Utz
January 25, 2021

Outline

- VIPER Mission
- VIPER Rover Software
 - Rover Flight Software
 - Rover Ground Software
 - Rover Simulations
- Rover Software Development
- Status

The background of the slide is a high-contrast, black and white photograph of the lunar surface, showing numerous craters and craters. A solid blue horizontal band is positioned across the middle of the image, serving as a background for the title text.

VIPER Mission Overview

VIPER: Surface Mission at the Lunar South Pole

- NASA's VIPER Mission is sending a rover to the south pole of the moon (Nobile region)
- It's objective is to characterize the surface and subsurface water ice at the lunar south pole in and around permanently shadowed regions (PSR's)
- The rover is operated in continuous communication from earth
- Only survival functionality during out-of-comms configurations (earth below horizon etc.)
- As the rover is solar powered operations will be carefully aligned with the movement of the sun/shadows over the lunar pole
- The rover survives short polar summer nights and operations in PSR's on battery power

Water at the Lunar Poles

Satellite data

- Clementine probe (1994): Bistatic radar experiment
- Lunar Prospector probe (1998): Neutron spectrometer

LCROSS Lunar impact (Oct 9,2009)

- Impacting an empty rocket stage into the moon
- LCROSS flying through and analyzing ejecta plume

VIPER Mission Parameters

- **Surface Duration:** ~100 earth days (4 lunar days)
- **Instruments:** Neutron, Near-IR, and Mass Spectrometers; 1m Drill
- **Drill Depth:** 1m (~3ft)
- **# of Subsurface Assays (drill sites):** ~32
- **Dark Survivability:** 50hrs
- **PSR Working Duration (w/drill):** 10hrs
- **Distance Travelled (goal):** ~27km (~17mi)

The VIPER Lunar Rover

aka VIPER Surface Segment

VIPER and its roving peers

Sojourner (1996)

0.6m x 0.5m x 0.3m

11kg

Top Speed: 0.5cm/s

Plutonium-238 RHUs

Mars Exploration Rover (2004)

1.6m x 2.3m x 1.5m

180kg

Top Speed: 5cm/s

Plutonium-238 RHUs

Mars Science Laboratory (2011)

3.0m x 2.8m x 2.1m

900kg

Top Speed: 4cm/s

Plutonium-238 MMRTG

Mars 2020 Rover (2020)

3.0m x 2.7m x 2.2m

1025kg

Top Speed: 4.2cm/s

Plutonium-238 MMRTG

Lunokhod 1 & 2 (1970/1973)

2.3m x 1.6m x 1.5m

840kg

Top Speed: 55cm/s

Polonium-210 heat source

Lunar Roving Vehicle (1971/1972)

3.1m x 1.6m x 1.5m

210kg

Top Speed: 500cm/s

2 silver-zinc 36 volt batteries

Yutu (2013/2019)

1.5m x 1.1m x 1.1m

140kg

Top Speed: 5cm/s

Plutonium-238 RHUs

VIPER (2023)

1.5m x 1.5m x 2.0m

430kg

Top Speed: 20cm/s

Electric heaters only

1 meter

VIPER Rover Parameters

- **Rolling Mass:** ~450kg (992lbs)
- **Communications:** X-band
 - 256kbps (DTE min.) / 2kbps (DFE min.) ¹
 - 6-15[s] round-trip latency / (24h x 14d x 3m)
 - Ground: DSN 34m dishes: Canberra, Goldstone, Madrid
- **Dimensions:** 1.7m x 1.7m x 2.5m (5ft x 5ft x 8ft)
- **Wheel Diameter:** 0.5[m] (20in)
- **Steering:** Explicit steer; adjustable suspension
- **Top Speed:** 20cm/s (0.5MPH)
- **Prospecting Speed:** 10cm/s (0.25MPH)
- **Waypoint Driving:** ~5m (16ft) command distance
- **Camera Look-ahead:** 8m (26ft)
- **Obstacles / Slopes:** 20cm (8in) / 15deg
- **Expected Cold Environment:** ~40K (-390degF)

¹ DTE = Direct-To-Earth / DFE = Direct-From-Earth

VIPER Instrument overview

Neutron Spectrometer System (NSS) NSS (NASA ARC, Lockheed Martin ATC)

PI: Rick Elphic (NASA ARC)

Prospects for hydrogen-rich materials while roving, mapping the distributions

Instrument Type: Two channel neutron spec

Key Measurements: NSS assesses hydrogen and bulk composition in the top meter of regolith, measuring WEH while roving

Operation: On continuously while roving

Specs: 1.9kg, 1.6W, 21x32x7cm (sensor) / 14x18x3cm (Data proc. module)

Near InfraRed Volatiles Spec. System (NIRVSS)

NIRVSS (ARC, Brimrose Corporation)

PI: Anthony Colaprete (NASA ARC)

Prospects for surface water “frosts” and evaluates excavated materials

Instrument Type: NIR Point Spectrometer, 4Mpxl Panchromatic Imager w/7 LEDs, 4-ch thermal radiometer

Key Measurements: Volatiles including H₂O, OH, and CO₂ & mineralogy, surface morphology/temps

Operation: On continuously while roving and during drill operations

Specs: 3.6kg, 29.5W, 18x18x9cm (spec) / 20x13x15cm (Obs bracket)

Mass Spec. Observing Lunar Operations (MSolo) MSolo (KSC, INFICON)

PI: Janine Captain (NASA KSC)

Prospects for surface volatiles while traversing and during drilling

Instrument Type: Quadrupole mass spectrometer

Key Measurements: Identify low-molecular weight volatiles between 1-100 amu, unit mass resolution to measure isotopes including D/H and O¹⁸/O¹⁶

Operation: Views drill cuttings, volatile analysis while roving and during drill activities

Specs: 6.0kg, 35W, 16x20x46cm

The Regolith and Ice Drill for Exploring New Terrains (TRIDENT) Drill

TRIDENT (Honeybee Robotics)

PI: Kris Zacny (Honeybee)

Excavates lunar regolith to 1-meter and measures forces, displacements and temperatures for regolith bulk properties

Instrument Type: 1-meter hammer drill

Key Measurements: Excavation of subsurface material to 100 cm; Subsurface temperature vs depth; Strength of regolith vs depth

Operation: Subsurface assays to 100 cm in <1 hr, depositing cuttings at surface

Specs: 18kg, 20W/175W (nom/max), 27x22x177cm

Software Architecture

Rover Software split architecture

- On-board - Rover Flight Software (RFSW)
 - Flight HW management
 - Operational safety
 - Basic rover surface mobility
- Off-board - Rover Ground Software (RGSW)
 - Deployed on the ground
 - Mobile robotics functions

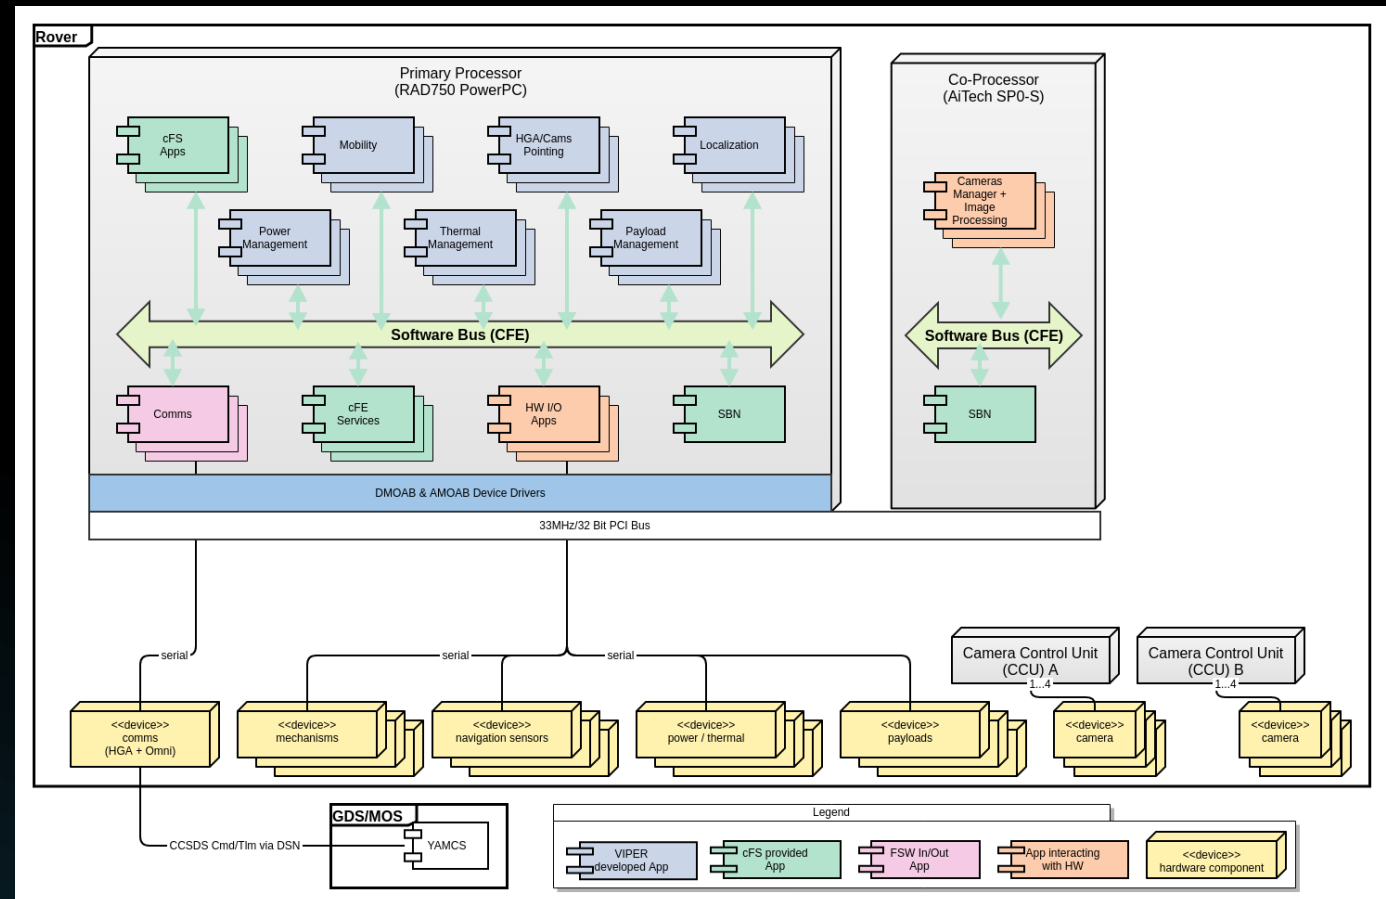

Rover Flight Software (RFSW)

Rover Flight Software

- Based on the NASA cFE/cFS middleware
- Implemented in C++
- Target platform is 2 PPC computers running VxWorks
 - Radiation hard main processor (RAD750, 200MHz, 1GB RAM)
 - Radiation hard co-processor (SP0-S, 1GHz, 1GB RAM)

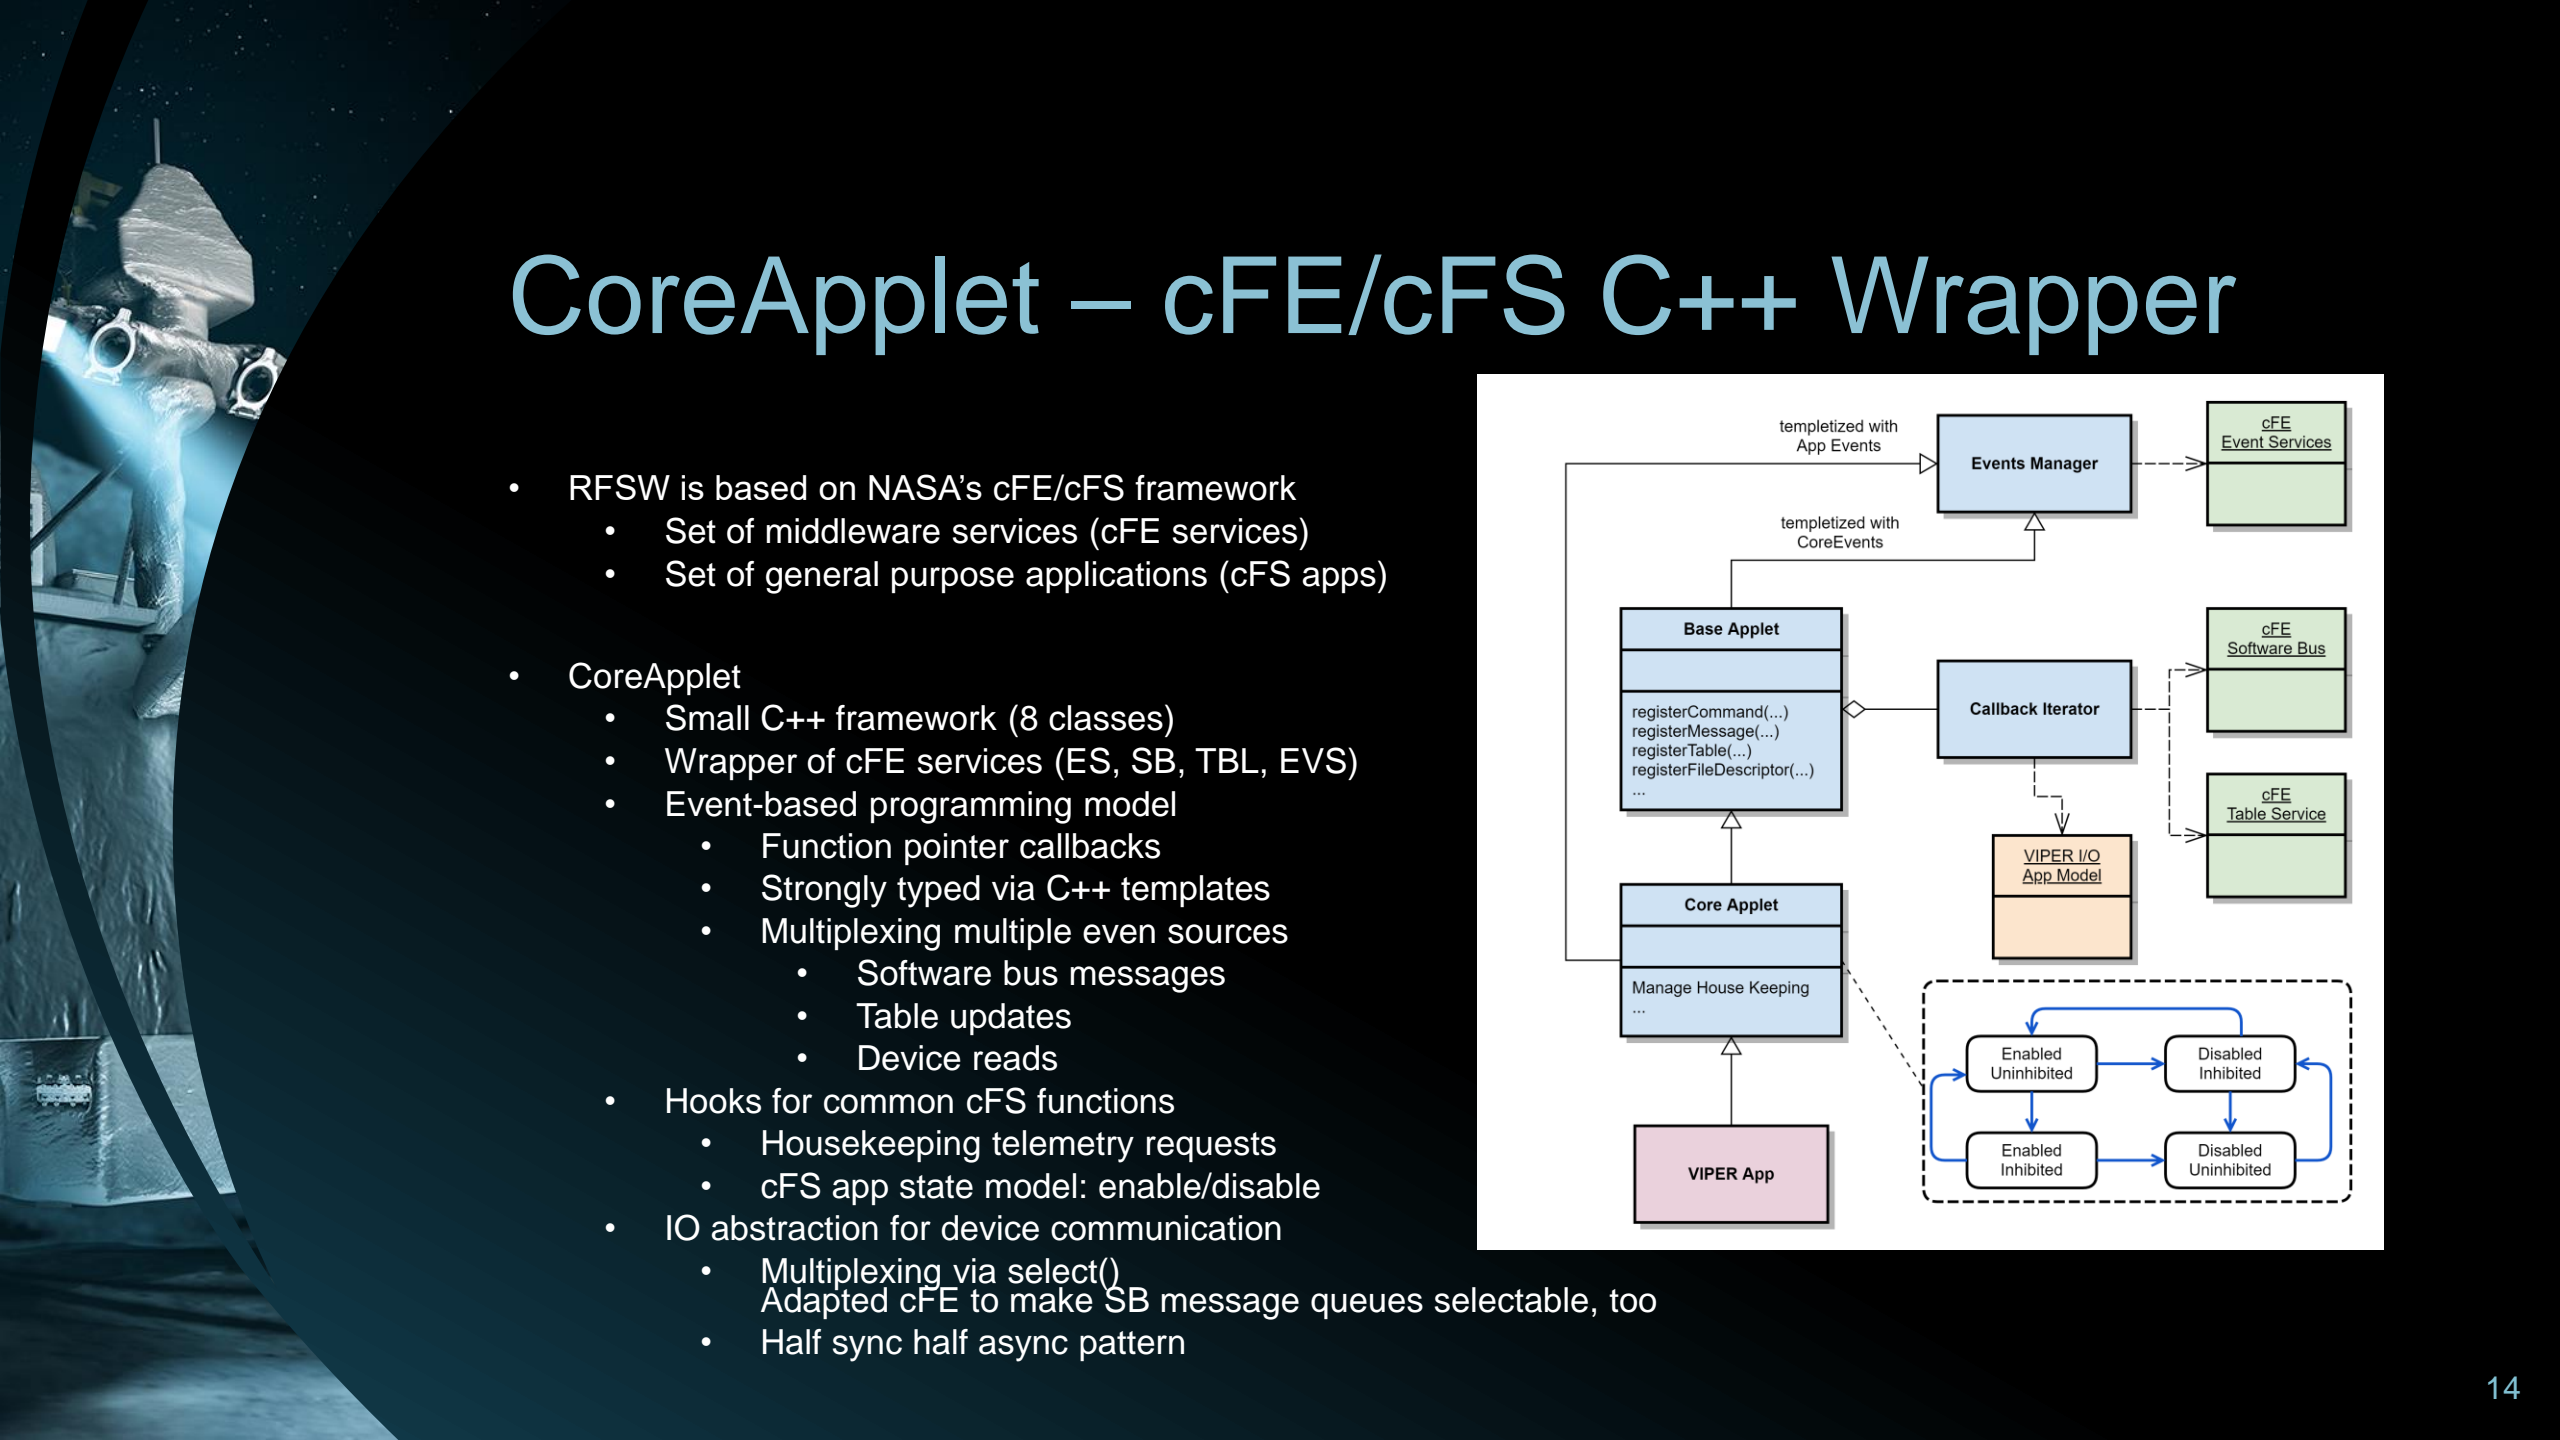

CoreApplet – cFE/cFS C++ Wrapper

- RFSW is based on NASA's cFE/cFS framework
 - Set of middleware services (cFE services)
 - Set of general purpose applications (cFS apps)
- CoreApplet
 - Small C++ framework (8 classes)
 - Wrapper of cFE services (ES, SB, TBL, EVS)
 - Event-based programming model
 - Function pointer callbacks
 - Strongly typed via C++ templates
 - Multiplexing multiple even sources
 - Software bus messages
 - Table updates
 - Device reads
 - Hooks for common cFS functions
 - Housekeeping telemetry requests
 - cFS app state model: enable/disable
 - IO abstraction for device communication
 - Multiplexing via select()
Adapted cFE to make SB message queues selectable, too
 - Half sync half async pattern

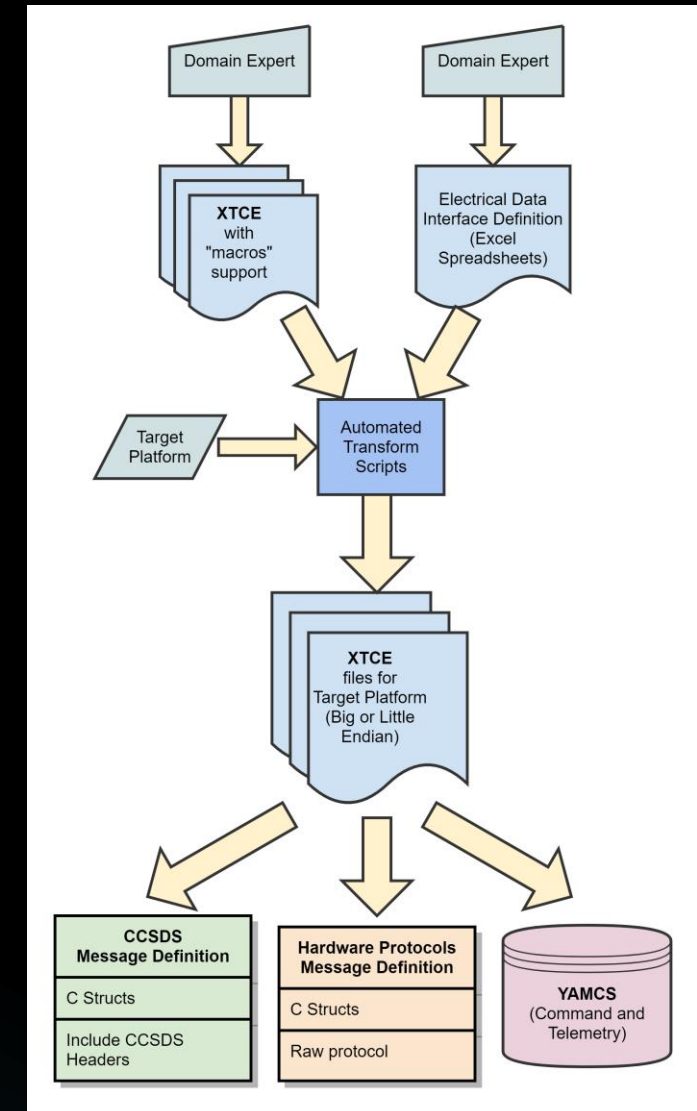

The diagram illustrates the CoreApplet architecture. At the bottom, the 'VIPER App' (pink box) inherits from the 'Core Applet' (blue box). The 'Core Applet' contains 'Manage House Keeping' and other functions. It inherits from the 'Base Applet' (blue box), which includes methods like 'registerCommand(...)', 'registerMessage(...)', 'registerTable(...)', and 'registerFileDescriptor(...)'. The 'Base Applet' is templated with 'App Events' and 'CoreEvents', which are then processed by the 'Events Manager' (blue box). The 'Events Manager' interacts with 'cFE Event Services' (green box). The 'Base Applet' also interacts with a 'Callback Iterator' (blue box), which in turn interacts with the 'VIPER I/O App Model' (orange box). The 'Callback Iterator' also interacts with 'cFE Software Bus' (green box) and 'cFE Table Service' (green box). A state transition diagram at the bottom right shows four states: 'Enabled Uninhibited', 'Disabled Inhibited', 'Enabled Inhibited', and 'Disabled Uninhibited', with arrows indicating transitions between them.

The 'Callback Iterator' is also connected to the 'VIPER I/O App Model' (orange box). A dashed box at the bottom right shows a state transition diagram with four states: 'Enabled Uninhibited', 'Disabled Inhibited', 'Enabled Inhibited', and 'Disabled Uninhibited', connected by arrows indicating transitions.

Interface Definitions (XTCE)

- XTCE
 - Interface definition language (IDL) for the YAMCS ground system
 - XML dialect describing types, data structures in complex detail
 - cFE/cFS does not provide it's own IDL
- Used for all interface definitions
 - Ground to RFSW
 - RFSW to hardware devices
 - RSIM using device XTCE for implementing device interfaces
- Single source of interface definition for different services and targets
 - Big endian and little endian targets (PPC & x86 Linux)
 - Filter tables for TelemetryOut (TO) and DataStore (DS) apps
 - Telemetry limit checker (LC) definitions for fault management
 - Binary on-board command sequences (RTS & ATS)

On-board Robotics Functions

Pose estimation (PEST)

- Local position tracking from wheel odometry (WODO)
- Attitude from start tracker & IMU

Kinematics control

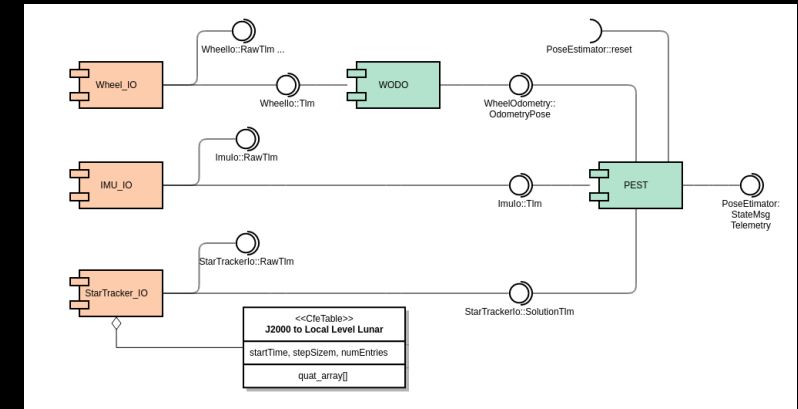

- Driving straight at crab angles
- Point turns
- Stance control
- Active suspension

Waypoint driving

- Driving to relative way point in straight line
- Control loop closed on orientation

Image pre-processing

- Bandwidth reduction before downlink
- Lossless & lossy compression techniques
- Requires some stereo (pre-) processing steps to be performed on board

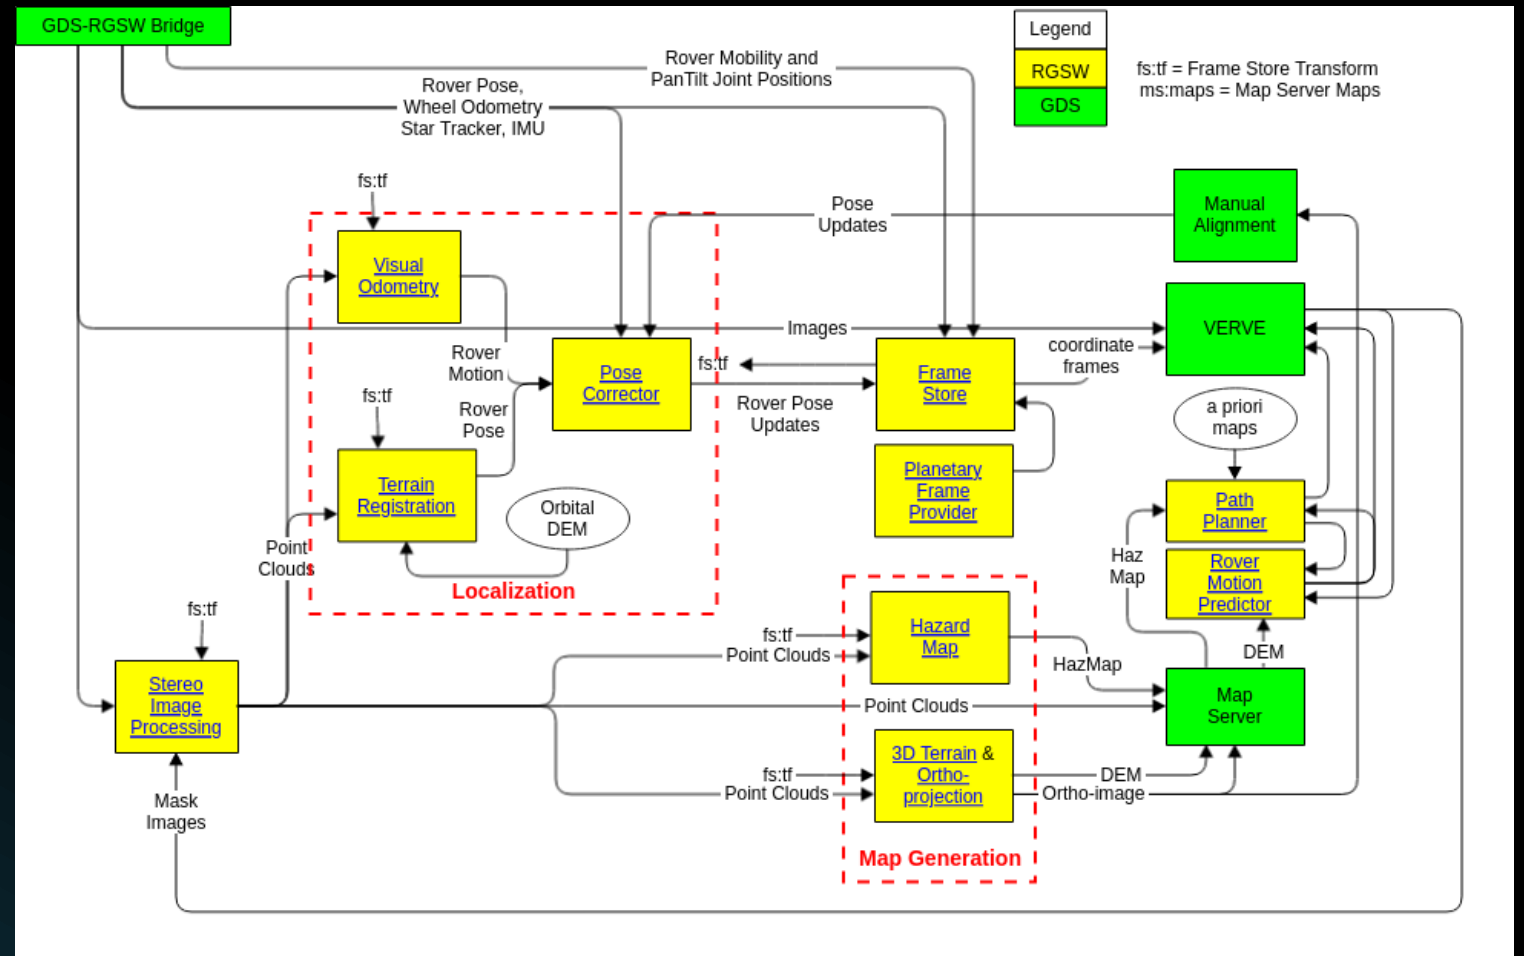

The background of the slide is a high-resolution image of the lunar surface, showing numerous craters of various sizes and depths. A solid blue horizontal band is superimposed over the center of the image, serving as a backdrop for the title text.

VIPER Rover Ground Software (RGSW)

Rover Ground Software Architecture

- Based on ROS2
- Deployed on the ground
- Linux workstations
- Large eco-system of Open Source robotics software
- Extended with mission specific functions and algorithms

RGSW – Relative & Global Localization

Stereo image processing

- Generating point clouds from stereo image pairs
- Mesh generation
- Mapping context images onto mesh as texture map

Relative pose estimation

- Visual odometry
- Input: stereo point clouds
- Consecutive single image pairs

Global pose estimation

- Terrain registration
- Matching stereo panoramas to orbital DEMs

RGSW – Mapping and Path Planning

Mapping

- Driver situational awareness
- Map generation from stereo point clouds
- Texture mapping to stereo point cloud
- Terrain hazard analysis (slopes, rocks & craters)

Path planning

- Path suggestions as human operator input
 - Advanced driver assist system (ADAS)
 - Terrain constraints vs pre-planned traverse path
- Motion prediction
 - No lateral/longitudinal on-board slip correction
 - Given terrain constraints and slip model
 - Predict most likely end-point of rover drive
 - Path of least surprise

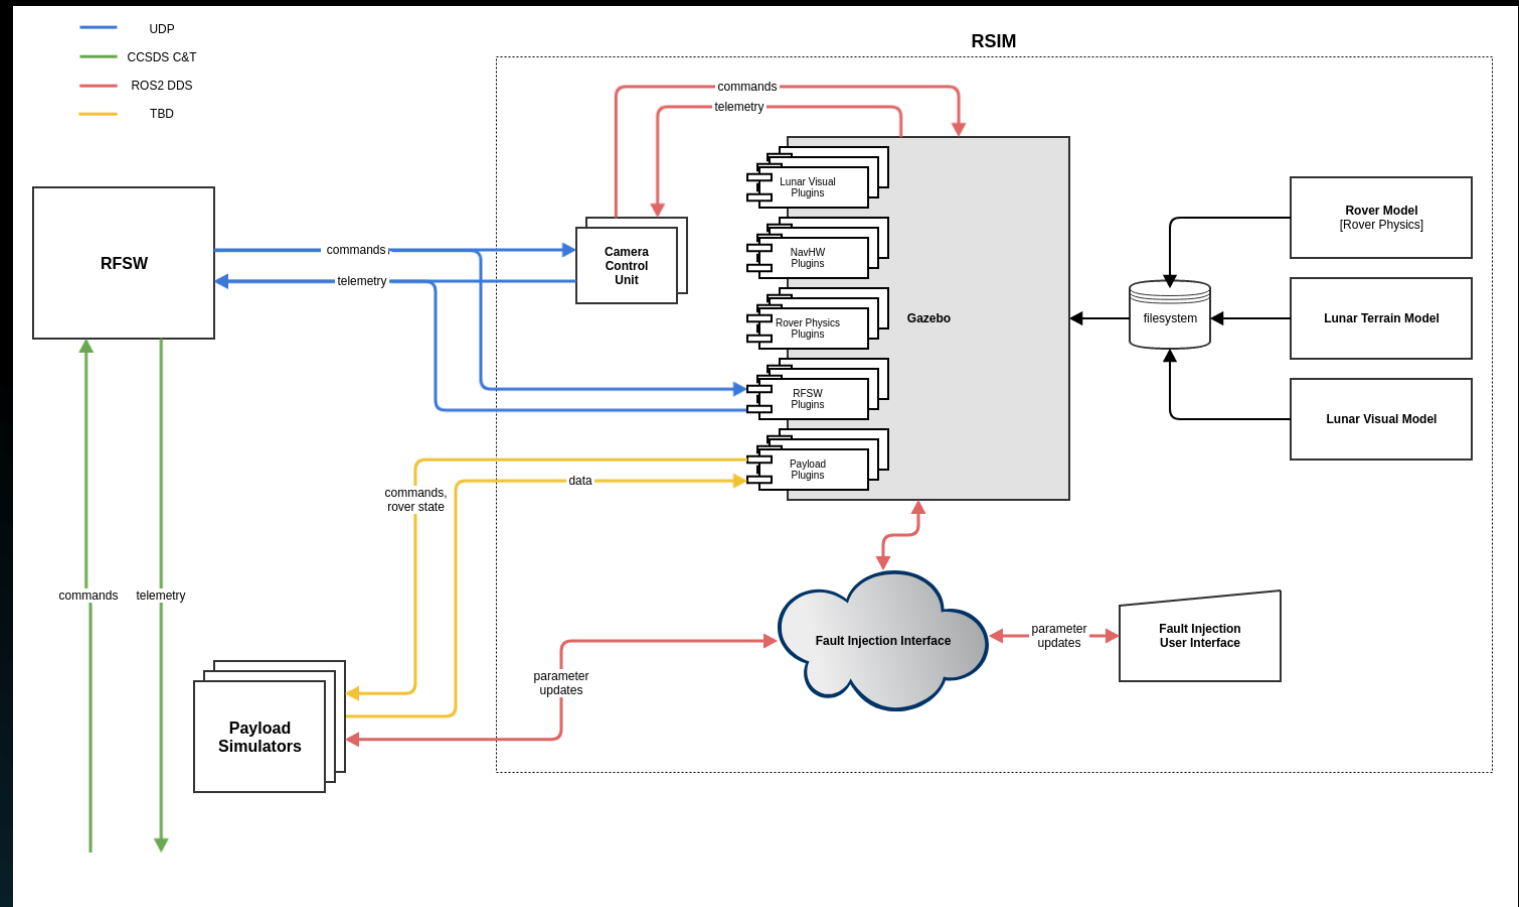

The background of the slide is a high-contrast, black and white photograph of the lunar surface. It shows a dense field of craters of various sizes, with some larger, more prominent craters having distinct rims and shadows. The lighting creates deep shadows within the craters, emphasizing their three-dimensional structure.

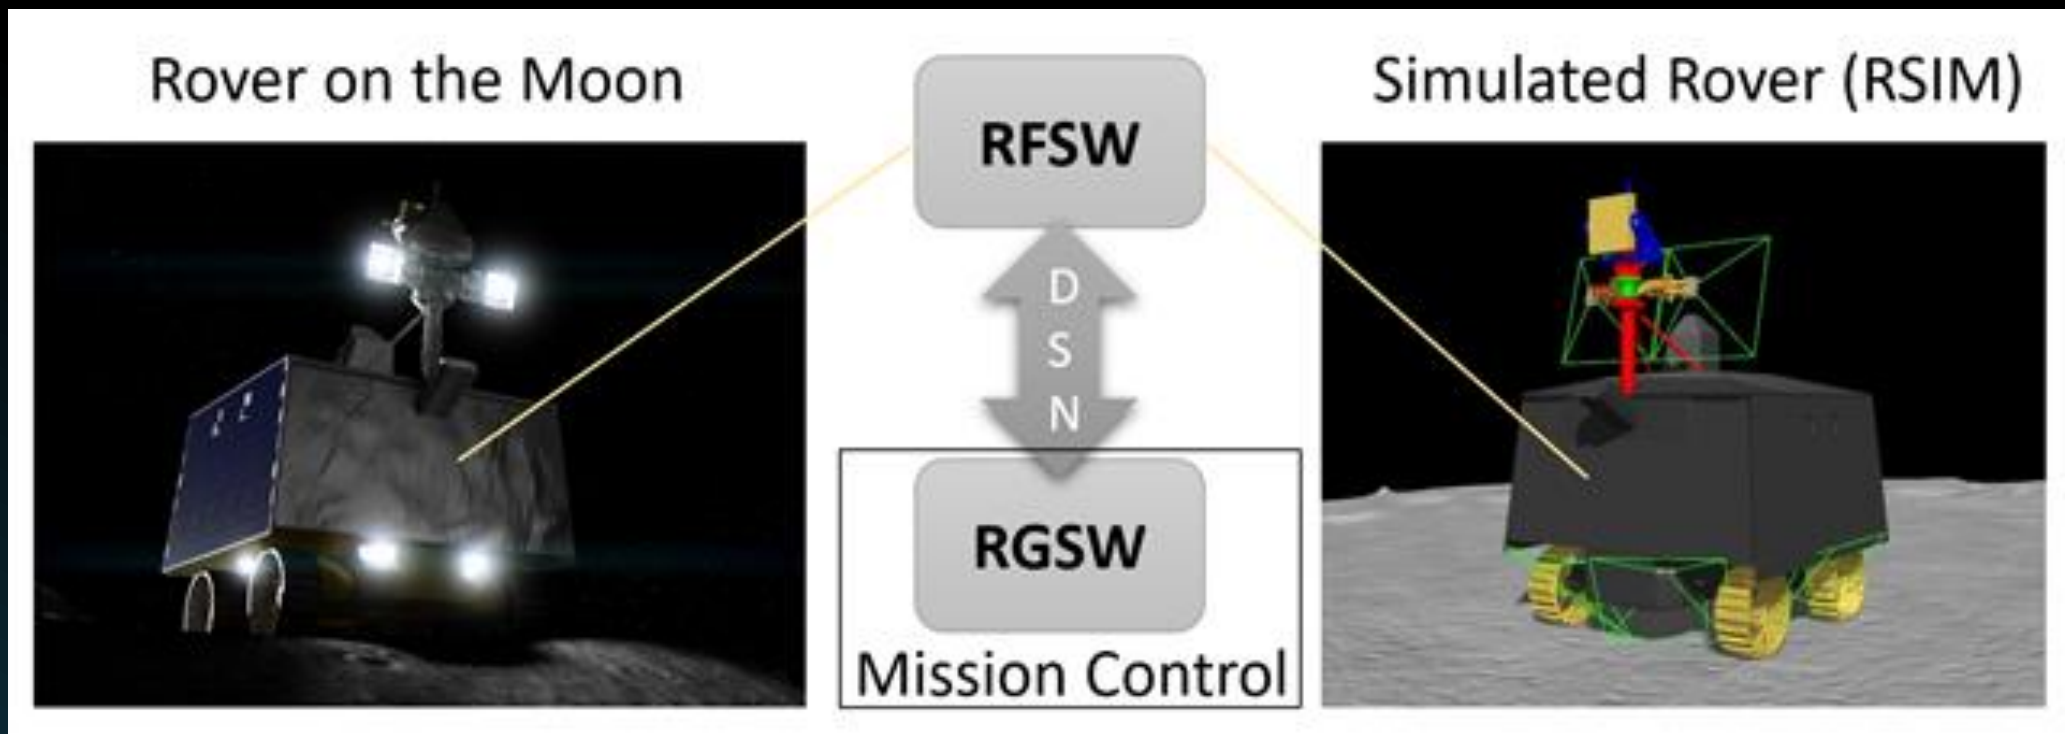

VIPER Rover Simulations (RSIM)

RSIM Architecture

- Gazebo based
- Ensemble of plugins
- Rover model
- Lunar terrain
- Lunar visual environment
- Rover sensors
- Rover actuators
- Fault injection

RSIM/RFSW Integration

- Devices modeled at the protocol level
- Connected via virtual serial ports/UDP (socat)

The background of the slide is a high-contrast, black and white photograph of the lunar surface, showing numerous craters and craters. A solid blue horizontal band is overlaid across the middle of the image, serving as a background for the title text.

VIPER Rover Software Development

Software Test Platforms

Supporting multiple platforms

- Different levels of fidelity
- Ease of access and tool support

Linux laptops and servers

- Familiar development environment for software team
- Immediate availability
- Advanced tools (valgrind, cachgrind...) for debugging and unit-testing

PPC Software Emulation (Qemu RAD750) with VxWorks

- Flight forward processor (big endian), memory, operating system, compiler toolchain
- Available on every developers laptop

Software Development Units (SDU) from previous mission

- Early availability of similar processor and accessory cards
- Risk mitigation such as early performance measurements etc

Engineering Development Units

- Requirements verification

Agile Development and DevOps

VIPER as a mission follows waterfall model

Rover Software is implemented in 7 build cycles/releases

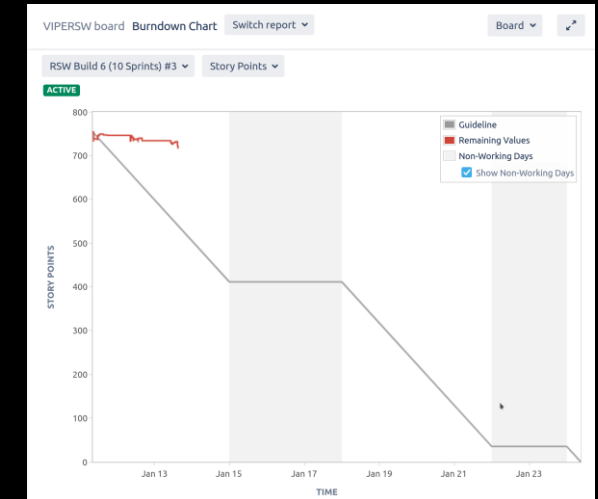

- Build spec defining the feature set
 - Build requirements
 - Software requirements
- Acceptance testing
- Integration and test phase with customers after release

Agile development within the build cycles

- 2 week sprints
- Concluding in project-open ShowAndTell

Development operations

- Continuous integration environment
- Building all sources on both supported platforms
- Running all automated tests: unit tests, subsystem test, end-to-end tests (RSIM)

Plan	Build	Completed	Tests	Reason
EZE test	#1589	12 minutes ago	No tests found	Manual run by Kitchin, Joseph A. (ARC-TI)[KBR Wyle Services, LLC]
QEMU	#49	16 minutes ago	No tests found	Manual run by Utz, Hans (ARC-TI)[KBR Wyle Services, LLC]
RFSW (18.04)	#1289	8 months ago	2884 passed	Changes by Tardy, Antoine (ARC-TI)[KBR Wyle Services, LLC]
RFSW (20.04)	#798	3 hours ago	3759 passed	Manual run by Tardy, Antoine (ARC-TI)[KBR Wyle Services, LLC]
RFSW Nightly	#46	14 hours ago	No tests found	Scheduled
RGSW (18.04)	#1003	5 months ago	No tests found	Manual run by Watkins, Jason (ARC-TI)[KBR Wyle Services, LLC]
RGSW (20.04)	#703	4 hours ago	144 passed	Manual run by Utz, Hans (ARC-TI)[KBR Wyle Services, LLC]
Riptide test	#321	14 hours ago	15 passed	Scheduled
ROS 2	Never Built			
RSim (18.04)	#542	8 months ago	No tests found	Scheduled
RSim (20.04)	#414	54 minutes ago	No tests found	Manual run by Kitchin, Joseph A. (ARC-TI)[KBR Wyle Services, LLC]
VxWorks Kernel	#92	6 hours ago	No tests found	Changes by Spain, Ivan M. (JSC-ER111)[Jacobs Technology, Inc.]

End to End Testing With RSIM

- RSIM as Rover Stand-in
 - Emulating all devices at the protocol level
 - Hi-fidelity simulation of lunar optical environment (cameras, light sources, optical surface properties)
- Running w/ unmodified RFSW on all test environments
- Chain including RSIM, RFSW, RGSW and ground tools such as YAMCS
- Python scripting of test procedures

<https://www.youtube.com/watch?v=w-ylrw0zdqM>

Status

- Build 6 of 7 started in December
- Feature complete with Build 6
- About 1 year from SW delivery
- Less than 2 years from launch (late 2023)
